2026. Ballistocardiographic changes in patients with chronic non-specific diseases of the lungs and cardiopulmonary insufficiency (Russian text) ZASLAVSKAYA R. M. *Moscow Terap. Arkh.* 1959, 31/1 (34-46) Graphs 11

The study of mechanics of the heart with the aid of ballistocardiography made it possible to reveal impairment of the contractile function of the myocardium in patients with chronic non-specific diseases of the lungs. The more characteristic changes: high amplitude of all the ballistocardiographic waves, marked respiratory oscillations of the IJ segment, relatively high H and L waves, elongation of the mechanical systole, the symptom of retardment of the beginning of the mechanical systole in relation to the electrical. Patients suffering additionally from cardiopulmonary insufficiency often had ballistocardiographic waves of low amplitude which is explained by considerable hypertension existing in the pulmonary circulation. As the symptoms of pulmonary, as well as cardiopulmonary insufficiency, decreased or were removed, a number of ballistocardiographic changes showed an improvement. Functional test with physical exercise (Master's test) made it possible, in separate instances, to spot the initial stages of cardiopulmonary insufficiency. As the pulmonary ventilation improved under the influence of broncholytic agents improvement was noted in a number of ballistocardiographic changes.

3344. ZASLAVSKAYA R.M. 1st Therap. Dept. of Centr. MPS. The electric sensitivity of the eye in patients with coronary insufficiency (Russian text) KLIN. MED. (Mosk.) 1955, 33/1 (58-63) Tables 1 Illus. 3

Cardiac infarction is now generally assumed to be of a cortico-visceral genesis. However, examination of the activity of the cerebral cortex for a clear judgment is difficult. It was therefore advised to examine the cerebral cortex through the visual apparatus. The object of the examination was to determine whether there were relationships between the electric stimulation threshold and processes in the organism. It had also to be established whether such tests can be effected without damage to the eye, and especially whether such damage would become manifest earlier than other signs in organs. In practice the test was applied by examination of the electric stimulability of the eye at dark adaptation in 100 patients with disturbances of the coronary circulation. The patients held an indifferent electrode in the hand, the different electrode was placed against the temple in the external canthus after dark-adaptation for 10 min. Then, a gradually increasing stimulating current was applied, until the patient perceived impressions of light. This minimal tension is the rheobase, which in dark-adaptation in normal persons is about 5 to 6 v. The lower the tension, the greater the sensitivity of the eye. Out of the 77 male and 23 female patients, 50 had stenocardia and 50 cardiac infarction. In both diseases, the ocular sensitivity was always decreased during the painful period. However, at the stage of repair of the infarction, the sensitivity gradually increases, which is verified by curves. Administration of nitroglycerin also led to increased ocular sensitivity. In deterioration and further development of the infarction, an increase, and finally disappearance of the sensitivity of the eye to stimulating currents was also observed. These phenomena may be caused by better cardiac circulation as well as by cure of the infarction or better cerebral circulation. (VI. 8, 12)

TITLE: Principles of a Relay Protective System for 110-kv Two-Wire Ground-Return Rural Lines (Printsipy vypolneniya releynoy zashchity liniy 110 kv sel'skokhozyaystvennogo naznacheniya po sisteme "dva provoda -- zemlya")

PERIODICAL: Tr. Transp. -energ. in-ta Zap.-Sib. fil AS USSR, 1956, Nr 5, pp 27-38

ABSTRACT: Expanding rural loads will, in the near future, result in rural 110-kv networks with long distances and small specific load densities as peculiar features. The two-wire ground-return system seems to be rational under such conditions. If such a line is supplied by a low-power system or by an individual power station, both the short circuit current feeding a distant fault and the no-load current determined by a large capacitance of such a line will be close in magnitude to the normal load current; therefore, the conventional overcurrent protection of such transmission lines becomes impossible. On

SOV/112-57-5-10132

Principles of a Relay Protective System for 110-kv Two-Wire Ground-Return

the other hand, the use of a complicated distance-type protective system is noneconomical and requires highly qualified operating personnel. A current asymmetry relay operating on phase-current asymmetry exceeding a certain setting is the most rational for this case. The relay connected to each phase consists of (1) an operating unit passing the difference of currents of two phases and (2) a restraining unit passing the current of the third phase. Ampere-turns of the operating and restraining units are so proportioned that under normal conditions, the torques of the both units are balanced. If the current in the operating unit increases, the relay in the faulty phase operates while the relay in the sound phase is restrained from operation. Examination of the relay torques for the least favorable conditions -- a line of 400 km long supplied by a low-power station -- reveals that the relay made insensitive to the no-load asymmetrical currents will reliably operate on any asymmetrical fault on the transmission line. The relay operating conditions improve as the length of the line decreases.

TITLE: Minimum Degree of Compensation for a Long Electric Transmission Line
(O minimal'noy stepeni kompensatsii dlinnoy linii elektroperedachi)

PERIODICAL: Tr. Transp.-energ. in-ta Zap.-Sib. fil. AS SSSR, 1956, Nr 6,
pp 39-52

ABSTRACT: Specified normal operating conditions of an electric transmission line — principally stability requirements and maintenance of voltage within prescribed limits at any point of the line — restrict the line carrying capacity to a definite range $P = f(l)$. This range is presented for a line, similar to the Kuybyshev-Moscow transmission line, supplied by steam-turbine and hydro-turbine generators. It is pointed out that a variation of the transmission constant B_k in case of longitudinally-compensated line can be treated as a variation of the line wavelength with the line wave impedance remaining

Card 1/2

SOV/112-57-5-10038

Minimum Degree of Compensation for a Long Electric Transmission Line

constant. The degree of compensation is determined as

$$K = \frac{B - B_k}{B} = 1 - \frac{\sin \alpha l_{ekv}}{\sin \alpha l}, \text{ where } B \text{ is the transmission constant of a non-}$$

compensated line, B_k is the transmission constant of a compensated line, αl is the noncompensated-line wavelength, αl_{ekv} is the compensated-line wavelength. It has been found that the minimum degree of compensation can be determined by reducing the equivalent compensated-line length to the limit length that corresponds to the transmission of the same power, under specified normal conditions, without compensating devices. The curves of the minimum degree of compensation plotted against the transmitted power and the transmission-line length are presented for the case of a longitudinal-compensation device, with or without reactors.

AUTHOR: Zaslavskaya, T. B., Candidate of Technical Sciences SOV/105-58-9-13/34

TITLE: Calculating the Active Power Losses in a Long Line by Means of the Root-Mean Square Current (Raschet poteri aktivnoy moshchnosti v dlinnoy linii po srednekvadratichtnomu toku)

PERIODICAL: Elektrichestvo, 1958, Nr 9, pp 58 - 59 (USSR)

ABSTRACT: For determining the active power losses in a long line, a simplified method was worked out in the Leningradskiy politekhnicheskiy institut (Leningrad Polytechnic Institute) and in the Gidroproyekt. In this method, all special conditions of current distribution in a long line are considered by assuming a hypothetical time of operation τ_m that differs from the actual one. However, the results obtained by this method are too inaccurate, while the determination of τ_m requires laborious preparatory work as well as the introduction of a number of additional approximations. In the report under review a method is given for determining the losses by means of the root-mean-square current. This method enables the power losses to be determined for a load at the end of the line in case the

Card 1/1

Calculating the Active Power Losses in a Long Line by Means of the Root-Mean Square Current SOV/105-58-9-13/34

line length, its cross section, and the number of lines per phase are known. Though not new in its concept until now, such a method of loss determining has been established neither in the USSR nor in other countries. Formulae (10) for the root-mean-square current, and (11) for the active power losses in the line, are derived. In (10) the first three terms give the root-mean-square current in the line without losses, while the last term takes into account the active resistance of the line. At a line length of 1200 to 3000 km, the last term amounts to 5 to 12% which cannot be neglected. Calculations with the use of (10) and (11) are very simple, the error not exceeding 2-4%. If compensating installations exist, the losses are found as the sum of the losses occurring in each of the line sections. There is 1 reference, 0 of which is Soviet.

TITLE: Broadband interference light modulator with piezoelectric-ceramic mirrors

SOURCE: Optiko-mekhanicheskaya promyshlennost', no. 8, 1966, 22-24

TOPIC TAGS: interference light modulator, laser application, piezoelectric ceramic/
TsTS-19 ceramic

ABSTRACT: This is a continuation of an earlier theoretical and experimental study (Optika i spektroskopiya v. 9, 1960, no. 4, p. 501) of the modulation of the light beam by an interference modulator. The present article describes a modulator whose bandwidth has been increased to 5 - 7 MHz (compared with ~1 MHz earlier) by replacing the piezoelectric crystal mirrors with polarized piezoelectric ceramics (TsTS-19). The construction of the interferometer, which is similar to the standard Twyman-Green design, is described. The instrument was tested both under continuous and pulsed conditions in modulation of light from an He-Ne laser (632.8 nm). The obtained static characteristic is such that pulsed modulation with approximate depth of 80% can be obtained at control pulse amplitude 150 - 170 v. When 1-μsec pulses are applied to both mirrors simultaneously in such a way that they are moved in opposite directions, a modulation depth of 85% can be attained at 130 volts. The modulator power consumption is less than one watt and the optical losses reached 70%, owing to the poor

quality of the reflecting surfaces of the piezoelectric ceramics used. Further decrease in the dimensions of the ceramics could increase the bandwidth. The authors thank Z. I. Rogozovskaya and her co-workers for help in preparing the piezoelectric-ceramic mirrors. Orig. art. has: 4 figures. [02]

The Thermal Resistance of Metallurgical Cokes. A. D. Zaslav.
(Koks i Khimiya, 1940, No. 10, pp. 26-29). (In Russian).
In the experiments reported, specimens of coke were heated in a coke-fired stove for 2-3 hr. and then cooled by spraying with water. In the first series of tests the effect of such heating on the surface flaking of specimens with different amounts of original flaking was investigated. Cokes with a small amount of original flaking increased this by developing new flaking, whilst cokes with a large amount of original flaking only exhibited a change in the nature of the flaking, the number of flakes decreasing while the long and deep flakes increased in size. Dropping and compression tests on hot cokes showed that it was less strong, the number of pieces formed in the dropping test being 11-2 times that formed in the cold state. Flaking lowers the resistance of cokes to the effect of high temperatures.

ASS. S. L. A. METALLURGICAL LITERATURE CLASSIFICATION

[illegible]

Production of potassium sulfate fertilizers from potassium chloride and mirabilite. A. I. Zaslavskii, S. S. Samoil and L. A. Sokolova. *Bull. Acad. Sci. USSR Div. Chem. USSR*, 1938, No. 1, 17-22 (in Russian). English transl. in *Chem. Abstr.* 32:1141. The solv. isotherms of the system K_2SO_4 - $NaCl$ - H_2O at -6° , 25° and 75° were investigated. The curvature of the crystal fields of K_2SO_4 and glaserite was determined at the same temps. by the method of isothermal det. In the isotherm -6° , the presence of a considerable glaserite field was established. The compn. of glaserite isolated from different portions of its field in the quaternary system at 25° and 75° were detd. The max. formation of the solid soln. of Na_2SO_4 in glaserite corresponds to the field with a higher Na/K ratio with a min. water content (at the boundary of the $NaCl$ and glaserite fields). The data are tabulated and plotted. The amts. of pure K_2SO_4 obtained by the exchange of KCl and Na_2SO_4 in H_2O increase with a decrease of temp.; thus, at 75° 21.1% of K_2SO_4 was produced, at 25° 30.2% and at -6° 38.0%. Glaserite formed as the result of the above exchange, within 30 min., contained an excess of Na_2SO_4 as a solid soln. Its K_2SO_4 content was about 76%

as compared with theoretical 78.6%. The max. yield (81.5%) of K in the form of glaserite was observed at 10° . The four 4-cycle schemes of treatment of KCl and Na_2SO_4 based on a new principle of the selection of final hexam. affording a considerable advantage over the usual schemes, are described. About 8 patent and 7 literature references. A. A. Podgorny

Mutual solubility of aluminum, sodium, potassium and iron nitrates in water in the presence of nitric acid. III. A. I. Zolotarev and Ya. A. Ravdin. *J. Gen. Chem.* (U. S. S. R.) 9, 1473-4 (1939); cf. C. A. 30, 10444. The soly. isotherms of the system $\text{Al}(\text{NO}_3)_3\text{-Fe}(\text{NO}_3)_3\text{-H}_2\text{O}$ at 0°, 20° and 40° were studied. The true equil. between the solid and liquid phases was effected by soln. of the salts at higher temps. and crystn., with vigorous stirring, at the given temps. The compn. of the solid phase was studied by Schreinemaker's method and by detn. of ds., n and m. ps. of the mixed crystals. The tabulated and plotted results show the formation of continuous series of mixed crystals of $\text{Al}(\text{NO}_3)_3\cdot 9\text{H}_2\text{O}$ and $\text{Fe}(\text{NO}_3)_3\cdot 9\text{H}_2\text{O}$ with unlimited soly. at all the temps. Chas. Blanc investigated.

The production of some barium salts. A. I. Zaslavskii.
Gosplan. Inst. Prikladn. Khim., Seriya Stokh 1948-50,
87-89 (1950); Khim. Referat. Lit. 1940, No. 2, 91.
 The method of producing BaCl₂ by carbonating BaS and
 CaCl₂ solns. has been modified: (1) The Ca(OH)₂ formed
 by mixing BaS and CaCl₂ solns. is sepd., and (2) the soln.
 is carbonated: CaCl₂ + Ba(SH)₂ + H₂O + CO₂ → Ba-
 Cl₂ + CaCO₃ + 2H₂S. This modification decreases by
 50% the consumption of CO₂, avoids losses of BaCl₂,
 and produces more concd. BaCl₂ and Ba(SH)₂ solns. The
 reaction BaS + MgCl₂ + 2H₂O → BaCl₂ + Mg(OH)₂ +
 H₂S was investigated for the production of pure H₂S. A
 preliminary soln. of the BaS soln. with H₂S and gradual
 heating of the soln. with MgCl₂ facilitate slow crystn. and
 better filtration of the Mg(OH)₂. Production of BaCl₂
 and other Ba salts from HCl and BaS melt was developed
 and optimum temp. conditions and quant. correlation of
 the components were detd. BaSiF₆ can be produced by
 const. mixing of BaS soln. with H₂SiF₆, a waste product of
 superphosphate manuf. Production of BaCO₃ and BaS
 comprised pptn. from 15-16% soda soln. and 11-16%
 BaS soln. heated to 80°.

W. R. Heon

New modification of lead dioxide and the texture of anodic deposits. A. I. Zakharenko, Yu. D. Kondrashov, and N. N. Tolkachov. *Doklady Akad. Nauk S.S.S.R.*, 72, 540-51 (1960).--The common tetragonal rutile-cassiterite-type

form of PbO_2 (henceforth to be designated as β - PbO_2 , in analogy with pyrolusite β - MnO_2) was obtained by chem. methods of prepn. such as decompn. of PbO_2 with $(NH_4)_2CO_3$ or oxidation of $PbCO_3$ in alk. soln. with Cl_2 , and by electrolysis of acid solns. of $Pb(NO_3)_2$ from $1/10$ N to 2 N at c.d. 0.0001-0.1 amp./sq. cm. Deposits with x-ray patterns markedly different with respect to the relative intensities of the lines were obtained from neutral solns. of $Pb(NO_3)_2$, $1/10$ N at c.d. 0.0001-0.003 amp./sq. cm. Electrolysis of $1/10$ N solns. of $Pb(OAc)_2$ at c.d. 0.001, and of solns. of $Pb(ONa)_2$ in NaOH in a wide range of concns. and c.d., gave PbO_2 deposits with a very small no. of x-ray lines and a high degree of orientation. Fine powders of these deposits proved, in x-ray diffraction, to be a new form of PbO_2 , designated as α - PbO_2 , orthorhombic, 4 mols. in the elementary cell, $a = 4.938$, $b = 5.939$, $c = 5.489$ Å., space group $D_{2h}^{12} = Pbam$. The pattern is an alternation in one layer of zigzag-shaped chains of populated and of empty octahedrons with a link length of 2 octahedrons. The packing is two-layer, hexagonal. Each O octahedron has 2 common edges with its neighbors. The cell contains 4 Pb atoms $O, y, 1/4$, with $y = 0.178$, and 8 O atoms with the coordinates $x_2 = 0.23$, $y_1 = 0.43$, $z_2 = 0.44$. The distance $Pb-O = 2.16-2.22$ Å.; the length of the common edge of the octahedron = 2.18 Å. This structure of α - PbO_2 is close to that of the orthorhombic modification of columbite ($Fe-Cb_2O_7$) with the octahedrons populated with one kind of atom.

2.

Structure of the modifications of manganese dioxide. Yu. D. Kondrashov and A. I. Zaslavskii. *Izvest. Akad. Nauk S.S.S.R., Ser. Fiz.* 18, 179-85 (1951).—X-ray analysis shows 7 different types of structure. β - MnO_2 (pyrochroite) obtained from $\text{Mn(NO}_3)_2$ by thermal decomposition, has $a = 4.386 \pm 0.001$ Å, $c = 2.855 \pm 0.001$ Å. The parameter of O atoms $z = 0.803 \pm 0.004$, and the bonds are mainly ionic. ϵ - MnO_2 (cryptomelan) obtained by slow oxidation of MnSO_4 with KClO_4 in $\text{H}_2\text{SO}_4 + \text{K}_2\text{SO}_4$ has $a = 9.815 \pm 0.001$ Å, $c = 2.847 \pm 0.001$ and the space group $C_{2h}^2 - P_{21}^2$. The ion coordinates and interionic distances in this structure are indicated. The structure resembles a zeolite structure, which explains ion-exchange properties of this compd. γ - MnO_2 (rammedelite) obtained by boiling of pptd. MnO_2 with 3N HNO_3 has $a = 9.22 \pm 0.01$ Å, $b = 4.40 \pm 0.01$, $c = 2.850 \pm 0.005$ Å, and belongs to group $D_{2h}^2 - P_{21}^2$. Its coordinates and interat. distances are indicated. Several structures have γ -type diagrams. One of these designated by the author as δ - MnO_2 and obtained by oxidation of $\text{Mn(NO}_3)_2$ in 2N HNO_3 by KClO_4 has $a = 2.785 \pm 0.001$ Å, $b = 4.412 \pm 0.001$ Å, and belongs to space group $D_{2h}^2 - C_{2h}^2$. Half-amorphous MnO_2 contg. 15-40% H_2O was also investigated. S. Pakawer

"The Structure of the Modifications of Manganese Dioxide," Yu. D. Kondrashev, A. I. Zaslavkiy, State Inst of Applied Chem

"Iz Ak Nauk SSSR, Ser Fiz" Vol XV, No 2, pp 179-185

This lecture is devoted to study of the structure of modifications of MnO_2 obtained in pure form by synthetic means and identical to natural modifications. The following are studied: beta-modification of MnO_2 (pyrolusite), alpha- MnO_2 (cryptomelan), gamma-modification of MnO_2 (hausmannite),

LC 187191

USSR/Physics - X-ray Analysis (Contd) Mar/Apr 51

and hemi-amorphous modification of MnO_2 . Give tables and figures of the intra-ionic distances between Mn and O and between O and O; also steric diagrams. The lecture was delivered at 3d All-Union Conference on Use of X-rays in Study of Materials held 19 - 24 Jun 50 in Leningrad.

Title : Determination of the Laue Class and Orientation of an Unfaced Crystal
from One Photograph of the Stationary Crystal in Polychromatic Radiation

Orig Pub : Kristallografiya, 1956, 1, No 2, 159-164

Abstract : The determination of the Laue class and of the orientation of an unfaced crystal is usually performed by taking three photographs in a flat cassette. This article proposes that this determination be performed for crystals giving a rich interference pattern by using a single photograph in a cylindrical cassette. The spherical coordinates of the reflexes and of the points of intersection of the zonal curves are determined with the aid of a grid of curves $\rho = \text{const}$ and $\varphi = \text{const}$. The data obtained are plotted directly on a Fedrov sphere, thereby simplifying the work and reducing the time of determination.

TITLE: Heat Conductivity of Alpha and Beta Modifications of In_2Te_3

PERIODICAL: Fizika tverdogo tela, 1960, Vol. 2, No. 11, pp. 2885-2893

TEXT: This is a report on measurements made on the heat conductivity κ_{lat} of the crystal lattice of $\beta\text{-In}_2\text{Te}_3$, which, due to the strong scattering of phonons on statistically distributed vacancies in the indium sublattice, is abnormally small as compared with κ_{lat} of adjacent compounds in the isoelectronic series. X-ray structural analyses were made in parallel to κ measurements. The X-ray phase analysis was performed with a diffractometer of type YPC-50-M (URS-50-I), and a device described in Ref. 9 was used for κ measurements in the range 80-400°K. The preparation of α and β -modifications of the specimens is accurately described. Measurement results are illustrated in diagrams. Fig. 1 shows $\kappa_{\text{lat}}(T)$ for cast and pressed specimens subject to different heat treatments (respective data

Card 1/4

B006/B060

are given in Table 2). κ_{lat} decreases with rising temperature, even exponentially in part. The least decrease (in fact, almost a constancy) was found in a cast coarse-crystalline specimen obtained by allowing the melt to cool down to 600-580°C. Fig. 2 shows the diffractometric intensity curves for these specimens. Fig. 3 shows further $\kappa(T)$ curves with an exponential course. The authors consider the cubic cell of In_2Se_3 with 4 Te atoms, 8/3 In atoms and 4/3 empty sites, and offer several simple relations among the characteristic parameters. The proportionality factor λ is estimated (the scattering cross section S being related by relation $S = S_{\text{vac}} \lambda$ to the vacancy cross section; $S = a^2 \pi^{1/2} \lambda / 4$, a being the lattice constant) for the temperatures 100 and 300°K. The calculation is made by the formula $\lambda = a C_v \alpha V_1 / \pi^{1/2} \kappa$, $V_1 = a^3 / 8$, $\alpha \approx 1/5$; κ_{lat} was found for both these temperatures to be $1.88 \cdot 10^{-3} \text{ cal/cm} \cdot \text{sec} \cdot \text{deg}$, and $1.66 \cdot 10^{-3} \text{ cal/cm} \cdot \text{sec} \cdot \text{deg}$, respectively. Hence, $\lambda_{100^\circ\text{K}} = 0.256$ and $\lambda_{300^\circ\text{K}} = 0.360$. The results obtained lead to the following conclusions: the heat conductivity of the

Card 2/4

86442

Heat Conductivity of Alpha and Beta
Modifications of In_2Te_3

S/181/60/002/011/029/042
B006/B060

high-temperature modification $\beta\text{-In}_2\text{Te}_3$ is very small and almost independent of temperature. This abnormally small value is explained by photon scattering on the statistically distributed vacancies in the indium sublattice. The heat conductivity of In_2Se_3 increases with the ordering of the lattice ($\alpha\text{-In}_2\text{Se}_3$ has $\kappa_{\text{lat}} = 2.68 \cdot 10^{-3} \text{ cal/cm} \cdot \text{sec} \cdot \text{deg}$ at 300°K and rapidly increases with dropping temperatures). Results are in good agreement with X-ray structural analysis results. The formation of the α -modification with heat treatment depends on the crystal size, as it is the slower, the larger the crystals. The authors thank V. P. Zhuze for having posed the problem and for interest displayed, and Ye.D. Devyatkov for her remarks, B. Ya. Moyzhes for discussions. A. V. Ioffe, Ilisavskiy, and Petrov are mentioned. There are 3 figures, 3 tables, and 11 references: 9 Soviet, 1 US, and 1 Japanese.

TITLE: Polymorphism of In_2Te_3

PERIODICAL: Fizika tverdogo tela, 1960, Vol. 2, No. 11, pp. 2872-2880

TEXT: This is in continuation of the paper published on p. 2858 of the present issue, where a report has been given on the electrical and thermal properties of In_2Te_3 . In the article considered here the authors report on their systematic studies conducted on the phase compositions of polycrystalline specimens, prepared under different conditions of synthesis and heat treatment, and on studies of the heating and cooling curves, determinations of specific gravity, as well as X-ray analyses of monocystals. In_2Se_3 was synthesized from high-purity elementary components by fusion (700-750°C) in quartz ampoules. The indium impurity was < 0.001%. The specific gravity of the α - and β -modification was pycnometrically determined in toluene and the following values were obtained: $d_{\beta}^{20^\circ\text{C}}$

Card 1/4

86440

Polymorphism of In_2Te_3

S/181/60/002/011/027/042
B006/B060

$\rho = 5.73 \pm 0.005 \text{ g/cm}^3$; $\rho_{20^\circ\text{C}} = 5.79 \pm 0.005 \text{ g/cm}^3$. The results (interplanar spacings and periods of identity) of X-ray analyses are compiled in a table. A detailed description is given of structural analyses made by Laue diagrams, and the atomic arrangement (72 In and 108 Te per elementary cell) is discussed. Fig. 7 shows cross sections through an elementary cell of $\alpha\text{-In}_2\text{Te}_3$ in perpendicular to [111]. Investigation results are summarized as follows: The structural transformation $\alpha\text{-In}_2\text{Te}_3 \rightleftharpoons \beta\text{-In}_2\text{Te}_3$ was studied. The exothermic transition $\beta\text{-In}_2\text{Te}_3 \rightarrow \alpha\text{-In}_2\text{Te}_3$ is a phase transformation of first kind which is accompanied by a density increase of 5.73 g/cm^3 over 5.79 g/cm^3 and which takes place between 620 and 520°C. The high-temperature form of $\beta\text{-In}_2\text{Te}_3$ has a ZnS-type structure with statistically distributed vacancies. The low-temperature form of $\alpha\text{-In}_2\text{Te}_3$ has a cubic face-centered lattice with $a = 18.50 \text{ \AA}$ and belongs to the space group $F\bar{4}3m$. The structure is based on a 9-layered cubic packing with three ordering principles. Results obtained explain the divergence of data supplied by Hahn and Inuzuka by the fact that the former observed

the high-temperature form and the latter, the low-temperature form of In_2Te_3 . The authors thank V. P. Zhuze for having posed the problem and for his interest, A. M. Yelistratov for his interest, and senior laboratory assistant T. B. Zhukova for her assistance in the experiments. There are 8 figures, 2 tables, and 8 references: 3 Soviet, 1 US, 2 German, and 1 Japanese.

TITLE: Structure of a New Antiferromagnetic Compound, BiFeO_3

PERIODICAL: Doklady Akademii nauk SSSR, 1960, Vol. 135, No. 4,
pp. 815 - 817

TEXT: The antiferromagnetic compound BiFeO_3 , which is described in this paper was produced along with other compounds at the Institute of Semiconductors of the AS USSR. Conventional ceramic techniques were applied for the production. Preliminary firings were carried out at 750° and 800° C, respectively specimens in powder form showed that the BiFeO_3 unit cell is nearly cubic and has a slight rhombohedral distortion. Detailed structural and crystallographic data as obtained from these powder patterns are tabulated and discussed. The structure of BiFeO_3 is assumed to be of perovskite type. The authors thank Ye. S. Sher and L. L. Vasil'yeva for supplying the preparation, and Professor G. A. Smolenskiy for his interest in this work.
